Q1. Intelligent Customer Feedback Analysis

CODE

```
def clean(text):
    text = text.lower().strip()
    text = text.replace(".", "").replace(",", "").replace("!", "")
    return text

def check(text):
    pos = ["good", "excellent", "happy", "best"]
    neg = ["bad", "poor", "worst", "hate"]

    p = n = 0

    for word in text.split():
        if word in pos:
            p += 1
        elif word in neg:
            n += 1

    if p > n:
        print("Positive")
    elif n > p:
        print("Negative")
    else:
        print("Neutral")

num = int(input("Enter number of feedbacks: "))

for i in range(num):
    feedback = input("Enter feedback: ")
    feedback = clean(feedback)
    check(feedback)
```

INPUT

```
3
Good product
Bad service
Excellent and best quality
```

OUTPUT

```
(no output)
```

Q2. Comprehensive Password Strength Checker

CODE

```
def check(password):
    u = l = d = s = 0

    for ch in password:
        if ch.isupper():
            u = 1
        elif ch.islower():
            l = 1
        elif ch.isdigit():
            d = 1
        else:
            s = 1

    score = u + l + d + s

    if len(password) < 6:
        print("Weak")
    elif score == 4 and len(password) ≥ 8:
        print("Very Strong")
    elif score == 3:
        print("Strong")
    elif score == 2:
        print("Moderate")
    else:
        print("Weak")

password = input("Enter Password: ")
check(password)
```

INPUT

ABC@abc123

OUTPUT

Q3. Structured Server Log Error Analyser

CODE

```
def errors(logs):
    e = []
    for i in logs:
        if "ERROR" in i:
            e.append(i)
    return e

n = int(input())
logs = []

for i in range(n):
    logs.append(input())

e = errors(logs)

print("Unique Errors:")
u = []
for i in e:
    if i not in u:
        u.append(i)
        print(i)

print("Error Count:")
for i in u:
    print(i, ":", e.count(i))
```

INPUT

```
6
INFO Start
ERROR Disk Full
WARNING Low battery
ERROR Disk Full
ERROR Network Error
INFO Stop
```

OUTPUT

(no output)

Q4. Email Domain Frequency Analyser

CODE

```
def domain(emails):
    d = []
    for i in emails:
        if "@" in i:
            d.append(i.split("@")[1])
    return d

n = int(input())
emails = [input() for i in range(n)]

d = domain(emails)

for i in set(d):
    print(i, ":", d.count(i))

m = max(d, key=d.count)
print("Most Used Domain:", m)
```

INPUT

```
3
ABC@gmail.com
PQR@gmail.com
Hello@saveetha.com
```

OUTPUT

(no output)
